

ABSTRACT

A device for labeling an object having a periphery, including a substantially planar member having oppositely disposed first and second surfaces with the length greater than the periphery of the object. A protruding tab portion is included for facilitating re-attachable at least partial separation of the device from the periphery of the object when the device is affixed about the periphery of the object. The device further includes printed indicia on at least one of a portion of the first surface and a portion of the second surface, and at least one adhesive on at least a portion of the second surface that is suitable for affixing the device about the periphery of the object.
